Wire Connection

The following diagram and table show the proper wiring connection

A shielded connecting cable must be used to meet the electromagnetic requirements. The shield of the connecting cable has to be connected on the pyrometer side.

Note : For J & K type Thermocouple Special Compensating cable is used.

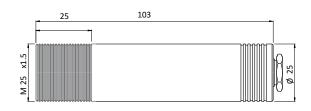

*Black Cable - J type

*Yellow Cable - K type

*Gray Cable - 0 to 5V/4 - 20mA/ 0-20mA

*While the pyrometer is connected to PC via "infralink" analog output must be connected for correct temperature measurement.

Serial communication protocol-MT500

This protocol is developed to use in the half duplex addressable communication mode. Master device should periodically issue requests to each Slave device. The request contains an address of polling "Slave" device. Slave device reply only on the requests issued by Master. Each Slave has its own address to recognize the issued request. AST sensors always operate as Slave devices. Using RS485 serial communication option allows connecting more than one sensor to Master device. AST sensors always perform delay of 5 ms before sending an answer on Master request to meet RS485 hardware requirement.

MT500_AST protocol uses only RD (Batch Read) and WD (Batch Write) commands. Sending other MT500 protocol commands causes sensor to consider it as error condition and answer with unknown command reply. Symbols enclosed within apostrophes ('symbol') means ASCII representation of the symbols. String enclosed with quotation mark ("string") means ASCII representation of the string (ended by '\0'). Data format is: <u>8 data bit</u>, <u>1 stop bit</u>, <u>No parity</u>, <u>baud-rate 19200</u>.

1 Byte	2 Bytes	2 Bytes	4 Bytes	2 Bytes	1 Byte	2 Bytes
STX	Station ID	RD	Address	Items	ETX	Checksum

Byte 1: Always STX (0x02)

Bytes 2, 3: The Station Number of the device to read from (2 Hex digits)

Bytes 4, 5: The command to execute (RD)

Bytes 6-9: This is the starting address to read from. Must be 4 bytes long

Bytes 10, 11: This is the number of addresses to read. Must be 2 bytes long

Byte 12: Always ETX (0x03)

Bytes 13, 14: The checksum is the lowest 8 bits of the sum of bytes 2 through 12

Example : Read two parameters starting from address 0000, from the station number 10 (0AH). This will read addresses 0000 and 0001.

Broadcast Message:

WD (Batch Write) command with Station ID of 0 is considered as broadcast message. Sensors process this command regardless of their Station Number and do not issue replies.

It is useful when master issues a request to change the same parameters of more than one Slave devices.
